Our Hypothesis

Agile + DevOps are key transformation practices for software delivery teams. But they are not enough. Organizations need help focusing on delivering value and business outcomes, while providing full end-to-end visibility to all stakeholders.

Agile/DevOps adoption

100% of respondents come from organizations that have adopted both Agile and DevOps.

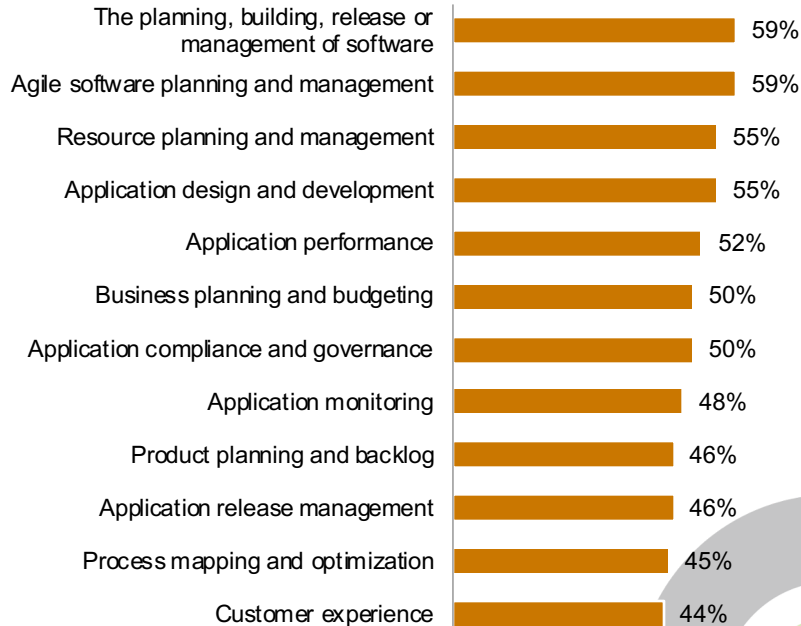

Role

■ IT
■ Business

Areas of significant involvement

Respondents had to be significantly involved in one or more areas to qualify.

Base: 305 global professionals involved in the planning, building, release, and/or management of software at enterprise firm.
Source: A commissioned study conducted by Forrester Consulting on behalf of CollabNet, July 2019.

Findings #1

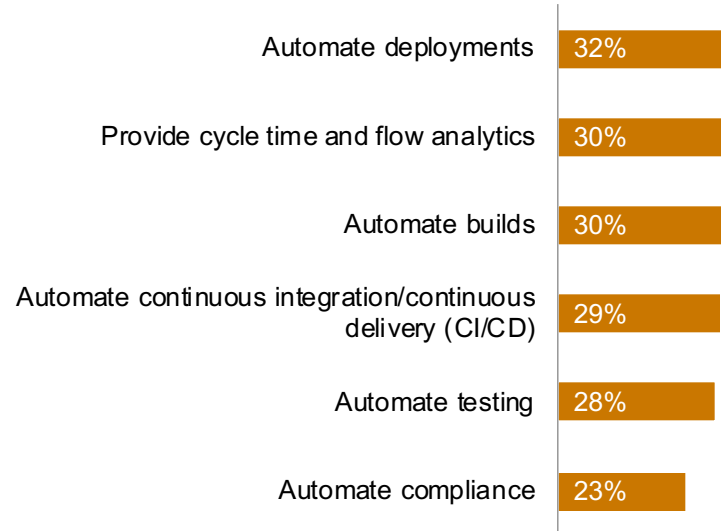

Organizations understand that they need software development and delivery processes that are fast, collaborative, and transparent, but more work lies ahead to bring this vision to life

Organizations are dissatisfied with their current toolchain's automation capabilities

Percent who rate their software delivery toolchain as excellent at performing each task.

Lack of organizational and metric alignment raise collaboration challenges

Which of the following, if any, present collaboration challenges between your AD&D and business teams?

(Select all that apply)

89% cite one or more of these collaboration challenges:

44% We are in separate orgs/ report to different leadership

39% We have different metrics

24% We don't have a common set of tools

23% The business has no visibility into the state of the AD&D schedule

22% AD&D is not informed about overall business objectives

Improper Workstream Management Leads to Fragmented Visibility

Enterprises are gapped in their ability to achieve business goals; <40% feel their organization does an excellent job in any one goal area

Percent who describe capability as very important to their software development/delivery success.

Percent who say their organization does an excellent job executing on each capability.

Few have a complete picture of work status

Visibility is most constrained at the story and enterprise levels

Percent that have complete visibility into the status of software development and delivery work at each level.

Respondents from **IT** were slightly more likely to have a complete picture at the **team level**, while those from the **business** were slightly more likely to have one at the **product level**.

Findings #2

An emerging approach to unifying and optimizing software delivery processes – Value Stream Management (VSM) – is gaining acceptance but some organizations identify roadblocks.

VSM is gaining traction and adoption is poised to accelerate

*For the purposes of this survey, **value stream management (VSM)** is defined as a combination of people, process, and technology that maps, optimizes, visualizes, measures, and governs business value flow (in the form of epics, stories, work items) through heterogeneous enterprise software delivery pipelines from idea through development and into production.*

Which of the following best describes your organization's adoption of VSM?

(Select one)

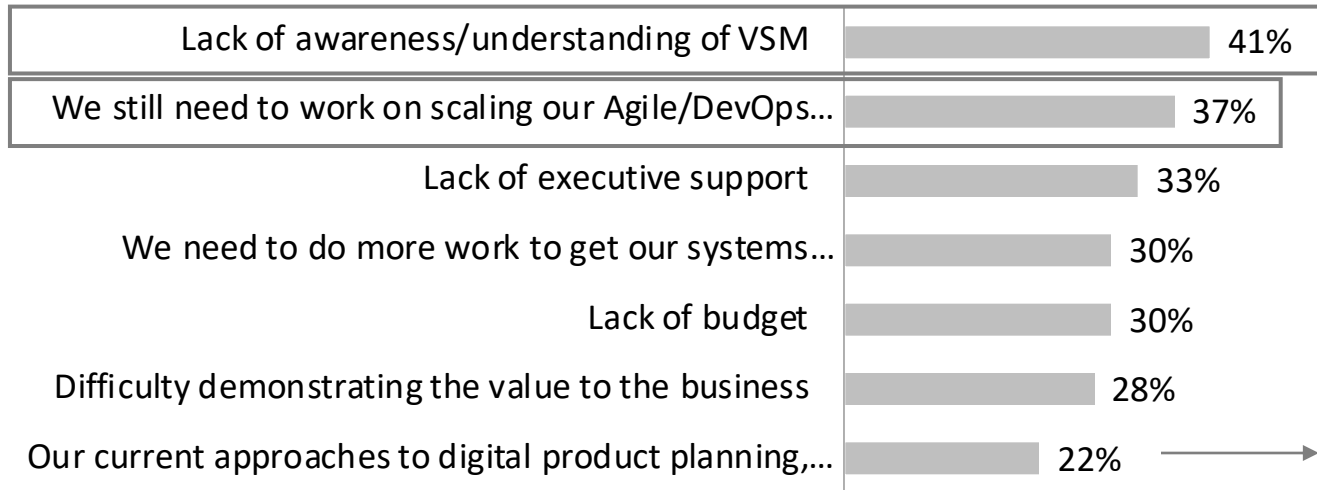

Base: 305 global professionals involved in the planning, building, release, and/or management of software at enterprise firm.
Source: A commissioned study conducted by Forrester Consulting on behalf of CollabNet, July 2019.

Nonusers without plans for VSM more often cite skill, tool, or cultural limitations as reasons for not pursuing VSM currently than they do access to adequate alternatives

Why is your organization not pursuing VSM currently?

(Select all that apply; showing top responses among nonusers with no near-term plans to adopt VSM)

Few nonusers have
adequate alternatives to
VSM

Those who have/plan to have VSM or have interest must navigate a variety of org/tech roadblocks along their adoption path

Which of the following are challenges for your organization when it comes to implementing VSM?

(Select all that apply; showing top challenges)

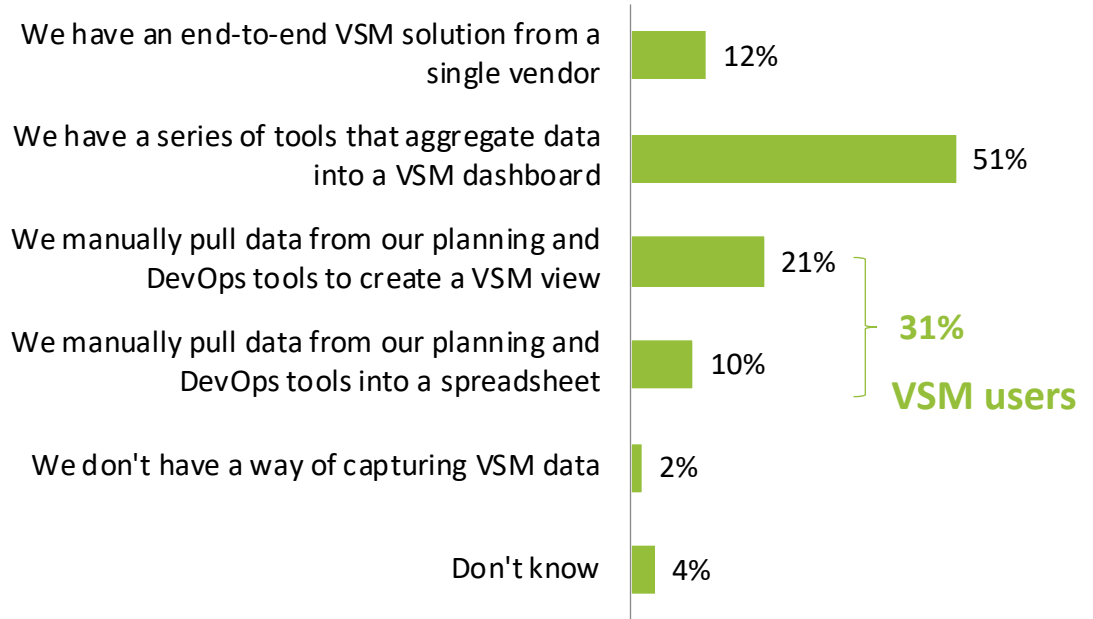

VSM initiatives most often depend on a collection of tools

Just 12% of VSM users have a holistic solution: 31% support their VSM initiatives with manual processes

Which of the following best describes your organization's VSM tool(s)?

(Select one)

Findings #3

While few have a mature VSM approach today, simply beginning the VSM journey has helped early adopters move the needle on key objectives.

VSM users are 2X more likely to have a complete view into the status development and delivery work at the product, portfolio, and enterprise

Percent that have complete visibility into the status of software development and delivery work at each level.

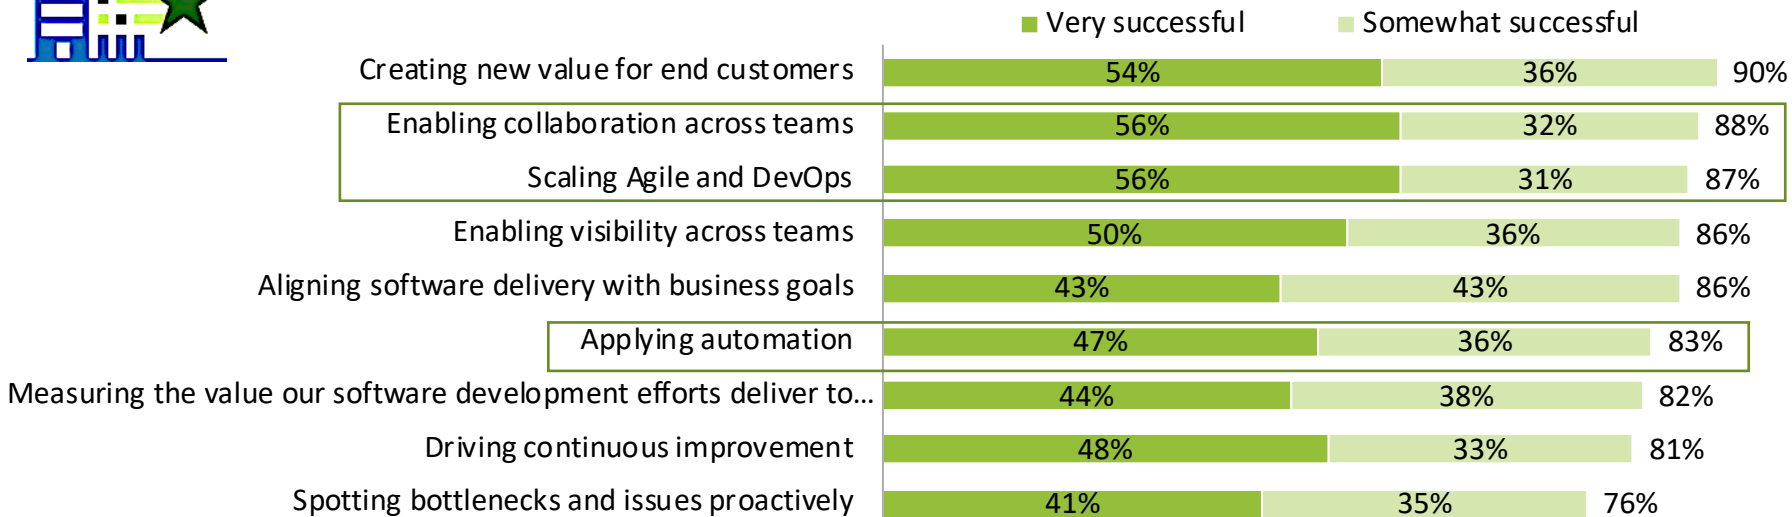

Between 80% and 87% of VSM users have complete or considerable visibility into these levels, relative to between 57% to 73% of non-users.

Over 75% of VSM users say their VSM initiative has been effective at supporting objectives important to their software development and delivery success

How would you rate the execution of your VSM initiative thus far in achieving each of these objectives?

Findings #4

Agile and DevOps are key VSM enablers, but without a product mindset, VSM initiatives will stall!

Agile and DevOps
are key VSM
enablers, but
without a product
mindset, VSM
initiatives will
stall

Which of the following actions has your organization taken to support its VSM initiative?

(Select all that apply)

VSM users

Findings #5

To realize VSM's full potential, users must overcome their current technology and process limitations by investing in a dedicated VSM platform.

Those that report using an end-to-end VSM solution are nearly 4X more satisfied with their tools than those with a manual approach

Which of the following best describes your organization's VSM tool(s)?

How satisfied are you with your current VSM tool(s)?

**Manually pull data from our tools
into a VSM view or spreadsheet**

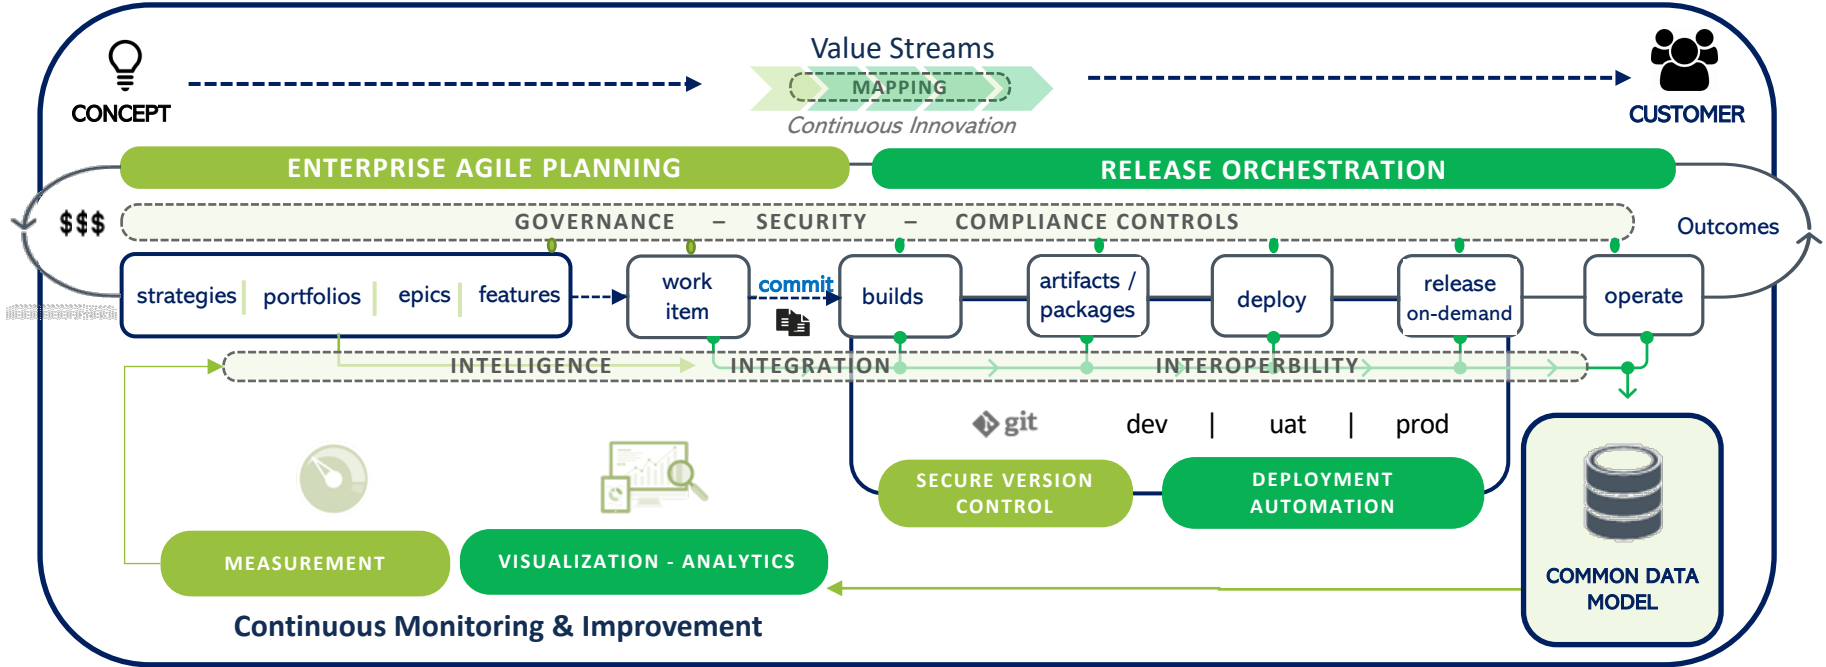

**A series of tools that aggregate
into a VSM dashboard**

**An end-to-end VSM platform
from a single vendor**
